# Forward-Looking Statements

During the course of this presentation, we may make forward-looking statements regarding future events or the expected performance of the company. We caution you that such statements reflect our current expectations and estimates based on factors currently known to us and that actual events or results could differ materially. For important factors that may cause actual results to differ from those contained in our forward-looking statements, please review our filings with the SEC.

The forward-looking statements made in this presentation are being made as of the time and date of its live presentation. If reviewed after its live presentation, this presentation may not contain current or accurate information. We do not assume any obligation to update any forward looking statements we may make. In addition, any information about our roadmap outlines our general product direction and is subject to change at any time without notice. It is for informational purposes only and shall not be incorporated into any contract or other commitment. Splunk undertakes no obligation either to develop the features or functionality described or to include any such feature or functionality in a future release.

# Clustering Fixup Cycle

---

# Fixup Lifecycle – to\_fix lists

#1 bucket  
added to  
to\_fix list

- ▶ The Cluster Master (CM) remembers a list of buckets it needs to fix.
- ▶ Every time a bucket is modified, the CM will add the bucket into any to\_fix lists that are needed
- ▶ There are multiple to\_fix lists, each corresponding to a different fixup
  - Generation, Replication Factor, Search Factor, Excess Buckets, Summary, etc.
- ▶ These lists are an internal list of all the buckets that **POTENTIALLY** need fixing
  - Very possible that nothing needs to be done - in which case they'll be removed on the service() call (part 2)

moved=116160, to_fix_total=104, count=22
```

## ► to\_fix\_rep\_factor=104

- buckets to check if we need/can schedule replications

## ► to\_fix\_added=116k to\_fix\_removed=116k

- likely a re-add operation – a peer resynced its buckets (restart) and most buckets were added/removed from the to\_fix list with little jobs scheduled

# Fixup Lifecycle – service

#1 bucket  
added to  
to\_fix list

#2 service()  
schedules  
Jobs

- ▶ Periodically, the CM will run through its service() loop
  - Defaults to every second, see the setting of “service\_interval”
- ▶ During the service() loop, the CM will iterate through ALL the bucket on all the to\_fix lists, and schedule any jobs that it needs to for repairs.

```
function service()
{
    for bucket in to_fix_lists:
        schedule_jobs_to_fix(bucket) // maybe schedule a job?
}
```

- (not actually taken from splunk/clustering.cpp)
- ▶ If the bucket doesn't need any jobs OR we've scheduled all jobs to fix a bucket, its removed from the to\_fix list

# Fixup Lifecycle – jobs

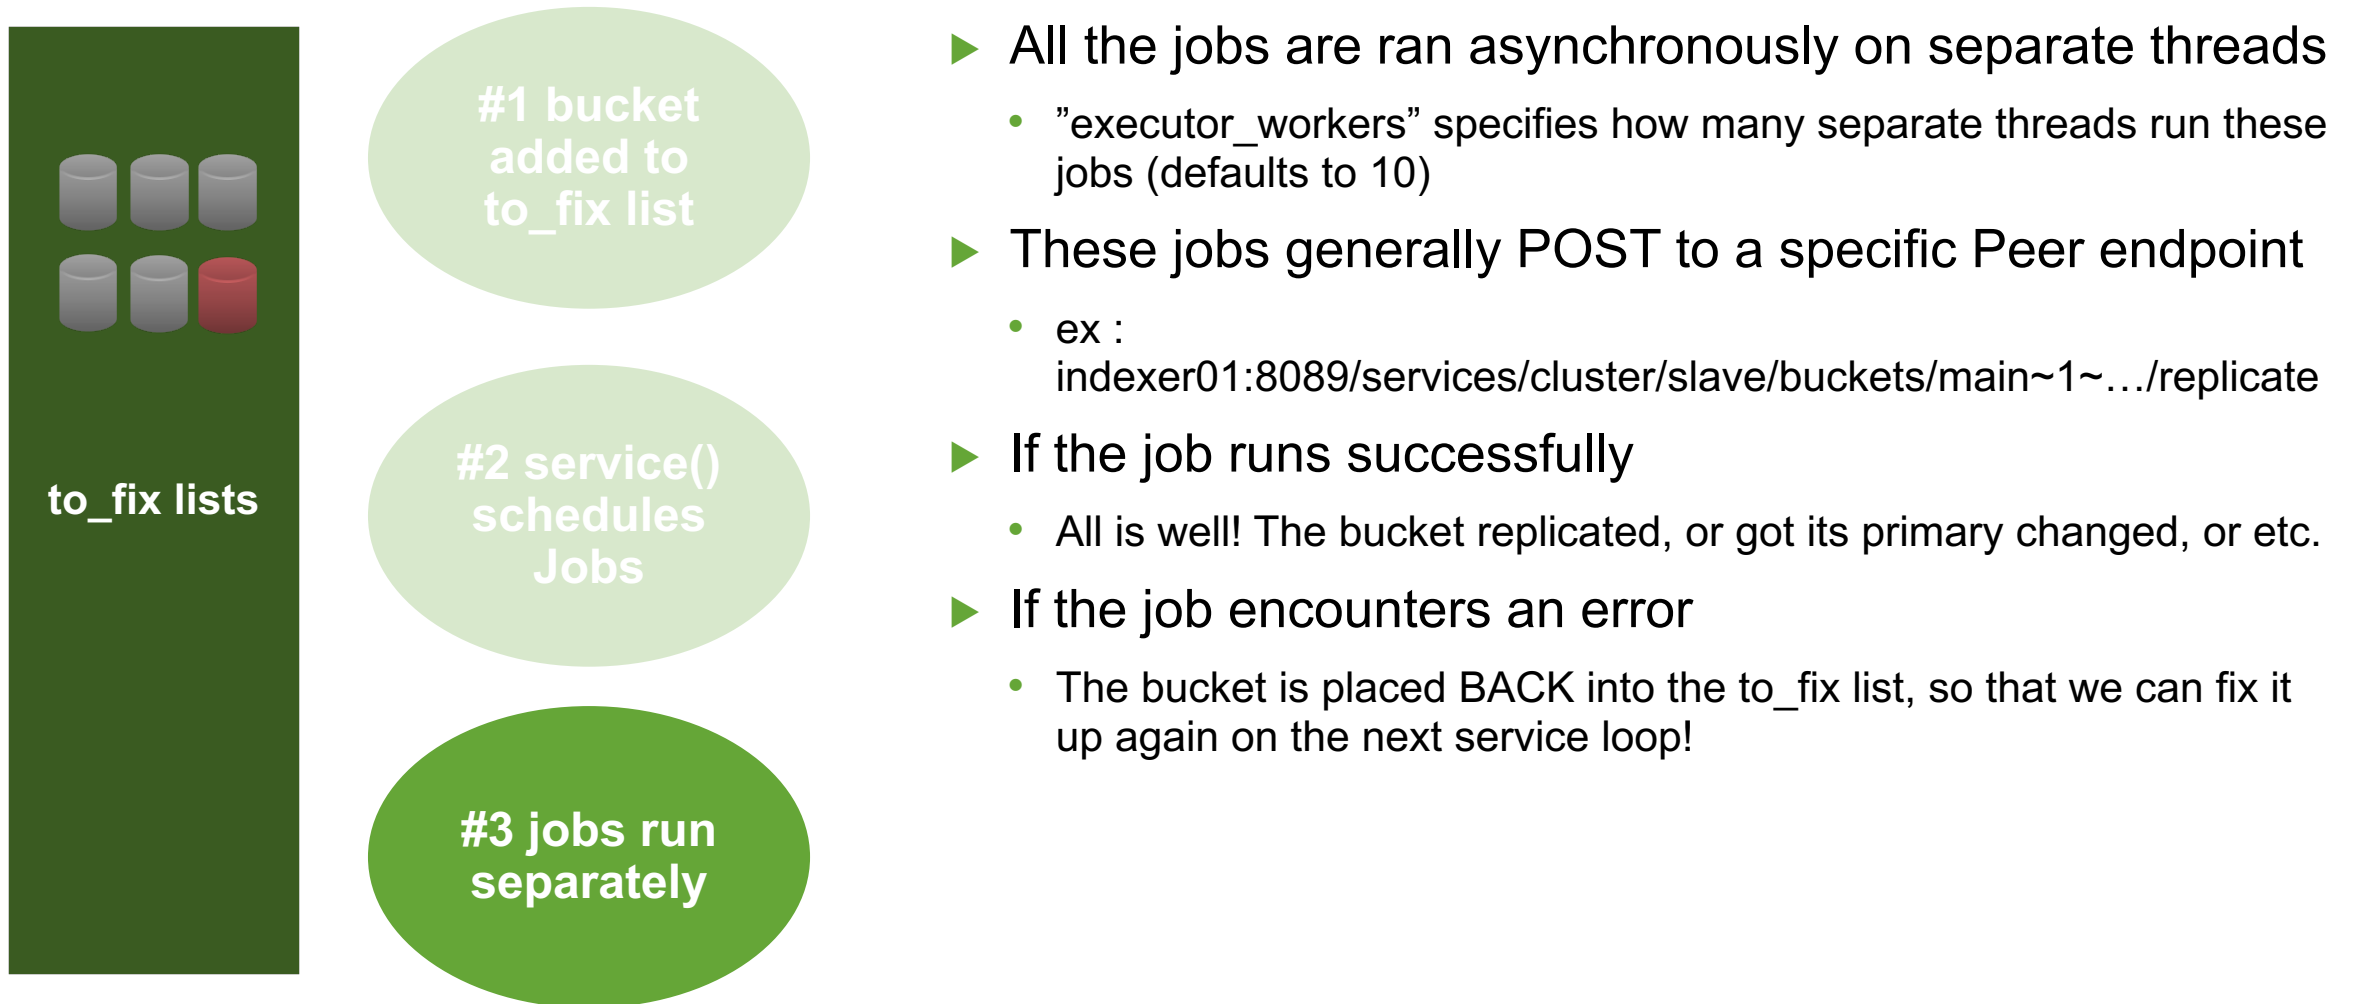

- ▶ Once service() schedules jobs, the CM has a threadpool running and picking up all the scheduled jobs.
- ▶ These jobs are generally REST POSTs to the cluster Indexers, telling them to run some command

Job name	Function
CMRepJob	Replicate a bucket (includes recipient info)
CMChangeBucketJob_build	Make bucket searchable (RF copy -> SF copy)
CMChangeMasks	Change bucket primaries (batch job, can change maybe buckets)
CMRollHotBucket	Roll a bucket from hot->warm
CMTruncJob	Truncate a bucket's size (remove bucket will use this with size=0)
